

Making a risky change safe: process, not just code

7 CHECKPOINTED TASKS

- one task at a time
- each ends: present the diff for review
- no auto-commit

1

SCOPE NARROWED ON PURPOSE

- verify SpinalFlow STANDALONE first
- against hand-specified tiles + real trace
- live wiring into combine(): deferred

2

ZERO REGRESSION, NON-NEGOTIABLE

- every touched task re-runs the pre-change cmd
- requires byte-identical output, every time

3

GROUND-TRUTH CHECK

- reconstruction checked vs independent spike count
- must match exactly, correct chrono order

4

META-LESSON

- narrow scope + checkpoint review + hard gates
- = many small proven changes, not one risky one

5
